

PC/104Plus—PCI interface with PCI **parallel** to the PC/104

The 6-DE-65/104RL & RH boards support a single PCI board from a PC/104Plus stack. They place the PCI board in a parallel plane to the PC/104 boards. The RL and RH models are identical except for the distance between the slot and the board. The RH board provides 0.625" clearance between the board and the PCI board. Where the RL board provides 0.200" clearance. The 'H' version is useful when a fan or heat sink is used on a CPU in the area covered by the PCI board.

The PCI slots are normally configured as slot 0; however, other options are available.
